

- 1978 - The **Stevfix** anchor: this anchor was designed with special fluke points for harder soils and a larger fluke area than the Stevin, but has been surpassed by the Stevpris anchor. It is no longer manufactured.

- 1979 - The **Stevmud** anchor: the Stevmud is essentially the Stevin anchor with a considerably enlarged fluke area. This anchor type was also surpassed by the Stevpris anchor and is no longer manufactured.

- 1980 - The introduction of the Stevpris and Stevshark anchors. The **Stevpris** anchor is a deep penetrating anchor with a plough shaped shank, surpassing the performance of all earlier designs in the vryhof range, and incorporating the latest experience, research and knowledge of the anchor designer. The Stevshark anchor is a specially reinforced Stevpris anchor, equipped with a serrated shank and cutter-teeth for better penetration in hard soils, such as coral types or sandstone. The fluke points are specially reinforced to withstand high point loads.
